

EE2023 TUTORIAL 7 (SOLUTIONS)

Solution to Q.1

- (a) Denote impulse response of system i by $y_{\delta,i}(t)$ and step response by $y_{step,i}(t)$ and note the relationship

$$y_{step,i}(t) = \int_{0^-}^t y_{\delta,i}(v) dv.$$

Hence, given the plot for $y_{\delta,i}(t)$, the corresponding step responses, $y_{step,i}(t)$, can be obtained by one of the following two ways:

- Performing graphical integration i.e. summing the area under $y_{\delta,i}(t)$ from 0 to t

or

- Assume first-order dynamics $y_{\delta,i} = A_i \exp(-\alpha_i t) u(t)$ recognizing that $A_i = 1$ for all 4 systems.

$$\underbrace{y_{\delta,1}(t) = e^{-\alpha_1 t} u(t)}_{\text{decaying exponential}} \quad \text{Point } (0.5, 0.6) \text{ lies on } y_{\delta,1}(t), \therefore 0.6 = e^{-0.5\alpha_1} \text{ or } \alpha_1 \approx 1.022$$

$$\underbrace{y_{\delta,2}(t) = e^{-\alpha_2 t} u(t)}_{\text{decaying exponential}} \quad \text{Point } (1.0, 0.6) \text{ lies on } y_{\delta,2}(t), \therefore 0.6 = e^{-1.0\alpha_2} \text{ or } \alpha_2 \approx 0.511$$

$$\underbrace{y_{\delta,3}(t) = u(t)}_{\text{unit step}} \quad \alpha_3 = 0$$

$$\underbrace{y_{\delta,4}(t) = e^{-\alpha_4 t} u(t)}_{\text{growing exponential}} \quad \text{Point } (2.0, 1.2) \text{ lies on } y_{\delta,4}(t), \therefore 1.2 = e^{-2.0\alpha_4} \text{ or } \alpha_4 \approx -0.091$$

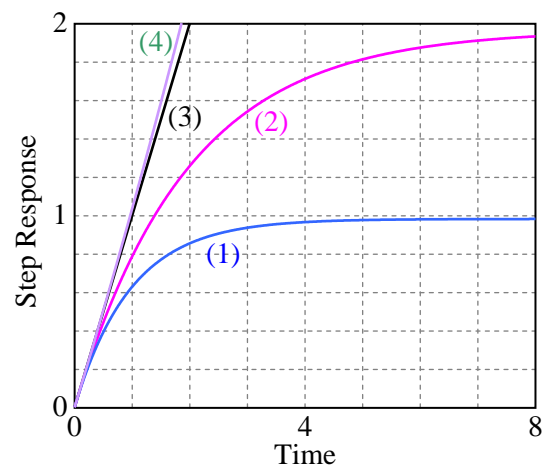

and perform integration to get

$$y_{step,1}(t) = \frac{1}{1.022} [1 - e^{-1.022t}] u(t)$$

$$y_{step,2}(t) = \frac{1}{0.511} [1 - e^{-0.511t}] u(t)$$

$$y_{step,3}(t) = tu(t)$$

$$y_{step,4}(t) = \frac{1}{0.091} [e^{0.091t} - 1] u(t)$$

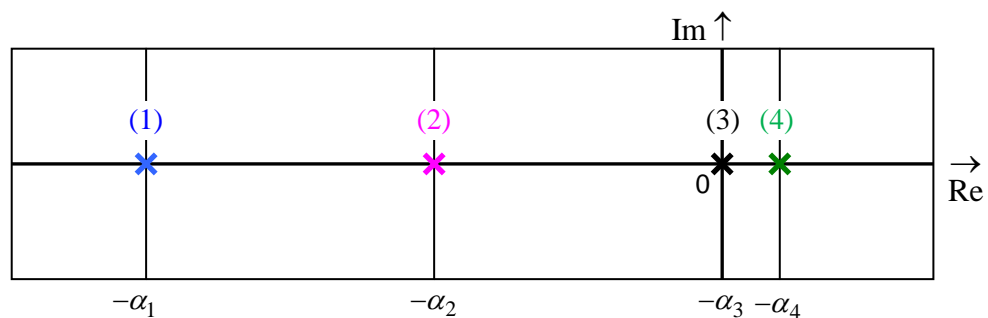

(b) The Laplace transform of $y_{\delta,i} = \exp(-\alpha_i t)u(t)$ is $\frac{1}{s + \alpha_i}$ where the pole is located at $-\alpha_i$. This implies that:

- If $\alpha_i > 0$ then the system is stable and a system with a larger α_i will have its pole further to the left of the $j\omega$ axis.
- If $\alpha_i = 0$ then the system is marginally stable and will have its pole on the $j\omega$ axis.
- If $\alpha_i < 0$ then the system is unstable and a system with a smaller α_i will have its pole further to the right of the $j\omega$ axis.

From the given impulse response curves, we make the following observations:

- The impulse responses of Systems 1 and 2 are exponentially decaying which implies that α_1 and α_2 are positive. These two systems are therefore stable with their poles to the left of the $j\omega$ axis. Since $y_{\delta,1}(t)$ decays faster than $y_{\delta,2}(t)$, we conclude that $\alpha_1 > \alpha_2$ and the pole of System 1 is to the left of the pole of System 2.
- The impulse response of System 3 is a unit step which implies that $\alpha_3 = 0$ and thus will have its pole on the $j\omega$ axis.
- The impulse response of System 4 is exponentially growing which implies that α_4 is negative and thus will have its pole to the right of the $j\omega$ axis.

Solution to Q.2

Objective is to find the parameters of the transfer function $G_i(s) = \frac{K}{as^2 + bs + c} \exp(-sL)$, ($i = 1, 2, 3, 4$), using information about the unit impulse responses and unit step responses.

Concepts needed to formulate solutions: $\begin{cases} G(s) = \text{Laplace transform of the impulse response} \\ \frac{G(s)}{s} = \text{Laplace transform of the step response} \end{cases}$

Process 1: Impulse response, $y_{\delta,1}(t) = 1.5u(t-1)$

$$\therefore G_1(s) = \frac{1.5}{s} \exp(-s)$$

Compare $G_1(s)$ with $\frac{K}{as^2 + bs + c} \exp(-sL)$, we have $K = 1.5$, $a = 0$, $b = 1$, $c = 0$, $L = 1$.

This is an integrator with dead-time $L = 1$.

Process 2: Impulse response, $y_{\delta,2}(t) = 4(t-0.5)u(t-0.5)$

$$\therefore G_2(s) = \frac{4}{s^2} \exp(-0.5s)$$

Compare $G_2(s)$ with $\frac{K}{as^2 + bs + c} \exp(-sL)$, we have $K = 4$, $a = 1$, $b = 0$, $c = 0$, $L = 0.5$.

This is cascade of two integrators with dead-time $L = 0.5$.

Process 3: Step response, $y_{step,3}(t) = 4(t-0.5)u(t-0.5)$

$$\therefore \frac{G_3(s)}{s} = \frac{4}{s^2} \exp(-0.5s) \rightarrow G_3(s) = \frac{4}{s} \exp(-0.5s)$$

Compare $G_3(s)$ with $\frac{K}{as^2 + bs + c} \exp(-sL)$, we have $K = 4$, $a = 0$, $b = 1$, $c = 0$, $L = 0.5$.

This is an integrator with dead-time $L = 0.5$.

Process 4: As the step response provided is a curve, it is not easy to derive a mathematical equation. A simpler approach is to match the step response in the problem with the step responses of common systems found in the lecture notes. Clearly, this is a stable first-order system with a dead-time.

A stable first order system is generally characterized by:

Transfer function: $G_4(s) = \frac{K_4}{sT_4 + 1}$

Impulse response: $y_{\delta,4}(t) = \frac{K_4}{T_4} \exp\left(-\frac{t}{T_4}\right) u(t)$

Step response: ... $y_{step,4}(t) = K_4 \left[1 - \exp\left(-\frac{t}{T_4}\right) \right] u(t)$

A stable first order system with dead-time L_4 is thus characterized by:

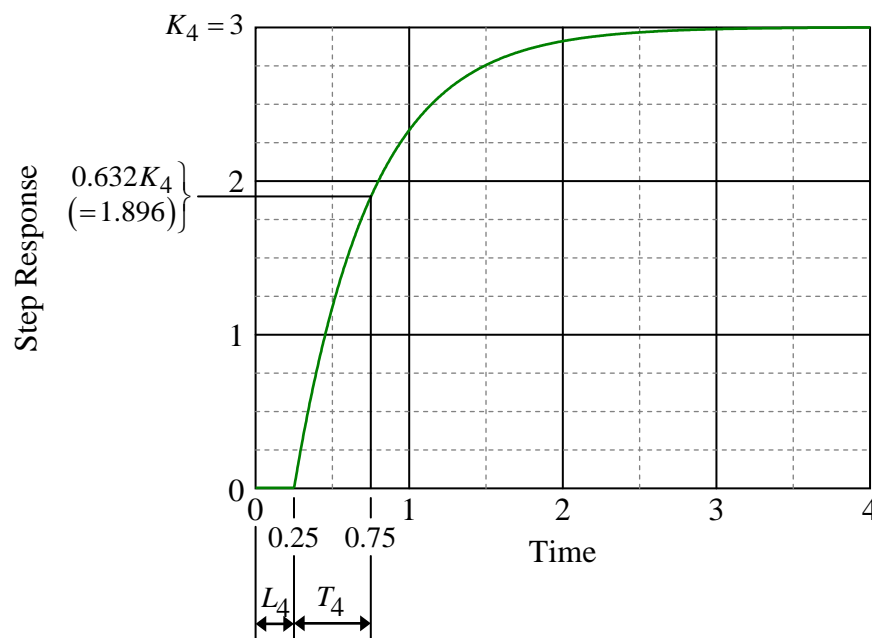

Transfer function: $G_4(s) = \frac{K_4}{sT_4 + 1} \exp(-sL_4)$

Impulse response: $y_{\delta,4}(t) = \frac{K_4}{T_4} \exp\left(-\frac{t-L_4}{T_4}\right) u(t-L_4)$

Step response: ... $y_{step,4}(t) = K_4 \left[1 - \exp\left(-\frac{t-L_4}{T_4}\right) \right] u(t-L_4)$ (♠)

Comparing (♠) and the given step response graph of $G_4(s)$:

- Since the system is stable and input is a unit step function, the steady-state response of the system given by $\lim_{t \rightarrow \infty} y_{step,4}(t) = 3$ is equivalent to the system steady-state gain and also the system DC gain. According to $G_4(s)$, the system DC gain is $G(0) = K_4$. Therefore $K_4 = 3$.
- Dead-time $L_4 = 0.25$ because the output signal starts to change 0.25 time units after the input is applied.
- Time constant T_4 is the time taken (after the dead-time) for the system to reach 63.2% of the final output value. This occurs when $y_{step,4}(T_4 + L_4) = K_4 [1 - \exp(-1)] = 0.632K_4$. From the graph, $T_4 + L_4 = 0.75$ or $T_4 = 0.5$.

$$\therefore G_4(s) = \frac{3}{0.5s + 1} \exp(-0.25s)$$

Compare $G_4(s)$ with $\frac{K}{as^2 + bs + c} \exp(-sL)$, we have $K = 3$, $a = 0$, $b = 0.5$, $c = 1$, $L = 0.25$.

Solution to Q.3

- (a) System unit-step response: $y_{step}(t) = 1 - 0.49\exp(-15.1t) - 0.51\cos(1.31t) - 0.97\sin(1.31t)$

Taking Laplace transform on both sides of the equation:

$$\frac{G(s)}{s} = Y_{step}(s) = \frac{1}{s} - 0.49\frac{1}{s+15.1} - 0.51\frac{s}{s^2+1.31^2} - 0.97\frac{1.31}{s^2+1.31^2} = \frac{N(s)}{s(s+15.1)(s^2+1.31^2)}$$

System transfer function: $G(s) = \frac{N(s)}{(s+15.1)(s^2+1.31^2)}$

System poles are located at: $s = -15.1, \pm j1.31$

- (b) System transfer function: $G(s) = \frac{s^2 - 3s + 4.25}{s^3 + (9+K)s^2 + (20-3K)s + 4.25K}$

System poles are roots of $s^3 + (9+K)s^2 + (20-3K)s + 4.25K = 0$.

Two methods for finding K :

- (i) Rearranging $s^3 + (9+K)s^2 + (20-3K)s + 4.25K = 0$ into

$$K = \frac{-s^3 - 9s^2 - 20s}{s^2 - 3s + 4.25}$$

and substituting either $s = -15.1$ or $s = j1.31$ or $s = -j1.31$ into it to get $K = 6.1$

- (ii) Expanding $(s+15.1)(s^2+1.31^2)$ into

$$s^3 + 15.1s^2 + 1.7161s + 25.913$$

and comparing coefficients with

$$s^3 + (9+K)s^2 + (20-3K)s + 4.25K$$

to get $K = 6.1$.

Solution to Q.4

$$\left(\begin{array}{l} \text{Steady-state response of a stable} \\ \text{system due to a unit step input} \end{array} \right) = (\text{Steady-state GAIN}) = (\text{DC GAIN})$$

The DC gain of $G(s) = \frac{K}{\tau s + 1}$ is given by $G(0) = K$.

Since it is given that the system input is a unit step and has unity steady-state gain, we conclude from the above that $K = 1$.

(a)

$$\left. \begin{array}{l} G(s) = \frac{1}{\tau s + 1} \\ Y_{step}(s) = \frac{1}{s} \cdot \frac{1}{\tau s + 1} = \frac{1}{s} - \frac{\tau}{\tau s + 1} \\ y_{step}(t) = 1 - \exp\left(-\frac{t}{\tau}\right) \\ \frac{dy_{step}(t)}{dt} = \frac{1}{\tau} \exp\left(-\frac{t}{\tau}\right) \\ \left. \frac{dy_{step}(t)}{dt} \right|_{t=0} = \frac{1}{\tau} = \underbrace{0.025}_{\text{Given}} \end{array} \right\} \therefore \tau = 40$$

(b) The steady-state unit step response is 1. Hence, the time taken for the thermometer to indicate 99% of the steady-state value can be obtained by solving

$$\begin{aligned} y_{step}(t) &= 1 - \exp\left(-\frac{t}{40}\right) = 0.99 \\ \rightarrow t &= 40 \ln(100) = \mathbf{184.2} \end{aligned}$$
